

## **Scenario:**

You are a busy college student looking to find a partner to train with in the gym. Between school, work, and other responsibilities, you find yourself lacking the time and motivation to find somebody organically. Recently, you have found and downloaded an app that will help you do just this! Use the app to complete the scenarios listed below:

**Task 1:** Open the app and create a new account. Be sure to upload a profile photo and fill out all of the demographic options.

**Task 2:** Once the new account has been created, begin choosing possible training partners whose demographics fit your criteria.

**Task 3:** Once a match has been found, message the user that you have matched with and setup a training session with the user.

## **Notes:**

### **Changes I Should Make:**

1. Add more demographic options on the profile setup screen. Adding sections for things such as height, age, etc. will allow for better and easier matches to be made via the app.
2. On the profile setup screen, add an icon that indicates where to click to add a profile picture.
3. Allow the user to swipe left or right as a way to vet potential matches.
4. Add an option to unmatched.
5. Allow the user to jump between the chats window and the potential match window more easily.
6. Add an in-app scheduling feature (could maybe sync to the user's calendar).

### **Things I Should Keep the Same:**

1. Keep the existing demographics on the profile creation screen (just add more).
2. Keep the "X" and "Check" buttons on the potential matches screen (even though the ability to swipe is needed, some users may still want to use the buttons).
3. Keep the way profiles are presented the same (picture, name, bio)
4. Keep the general aesthetic of the app the same.
